

Subzero Preservation

How?

Preserving the past involves thinking about the present and the future. The concept of stopping time means stopping by the force something that is going to change over time, but we want to be witnesses that it existed, exists and will exist on our planet. That's why we resorted to an element that destroys everything in its path but can also be kept, objects of all kinds, in a stationary state. This happens thanks to its changing state from liquid to solid, water. We want to show that thanks to the qualities of ice preservation we can hold part of a village in a stationary way, distant the passage of time but no stranger to the fluidity of living beings. Using liquid nitrogen and water may be possible to convert homes in ice. For security reasons and theory roads, trails and corridors inside buildings are not frozen. The roads will always grow, while wrapping and keeping in touch the world can not remain immobile. Another important aspect is to give prominence to the name of the Place. Pyramiden. Due to the generate shadow by the artificial pyramid over half the town this will remain frozen. Allowing to observe the past and present -future of the town.
