Axonometric view

We can create architecture with a defined spatial fantasy, as far as there is a human encounter in to this fantasised space there will be an inevitable implication of invented program. Where as Site is a platform that architecture can exist on, so with respect to this statement and our fantasised space any kind of defined fantasised space can complement spatial qualities on the stage/platform that they exist on. This project will be perceived by an ordinary

person as useless entity ['Mistake'], but having a physical dimension of space witnessing a design process, which focuses on creating a space without the need for immediate contextual site and programmatic conditions. This proves the idea that architecture can be envisioned without any context and program.
