

From waking up to the ring of alarm to travelling to school/office in a car with anytime anywhere navigation system to playing virtual reality games to creating presentations at work to ordering dinner online, technology has become an inevitable part of our lives since long. Sieving out technology from our lives is next to impossible.

But with increased involvement of technology, offline personal and public life of a person also started to deteriorate at a very fast pace. And it is not technology but we humans, who are at fault for creating this imbalance.

Architecture too, as an intervention failed to create a balance between offline and online life of a person.

Therefore, Architecture must take deeper steps to bridge the gap between technology and physical interaction.

This space will repeatedly be placed at various locations, acting as one such bridge wherein people break through the bubbles of virtual life and enter into free world. This space is much healthier and livable. Here, both virtual and real world complement each other.
