the bench**

The ideal rooms for communication exist though we often forget them. Architects have continuously been trying to create spaces for communication during all times, but technologies change: The physical presence begins to interfere with digital communication. Within modern man's history of 30.000 years, it has only been commonly possible during the past 20 years, to communicate wirelessly to all other places than our physical location. The constant digital distraction has to be articulated:

**The Ideal room for communication is not one single place, but a generic idea. This proposal suggest separating our presence in the world into two spaces:**

- 1) A room for our digital life and communication
- 2) A room for our physical presence - Our surroundings.

The one room is not better than the other, but both become intensified when separated. The distant digital conversations become sharper and the physical space gets present and direct. It can be difficult to know whether the body you communicate with connects to its mind. What if you could be certain about it? When we use our digital tools, we already step into another social room, and this proposal want to make this digital room spacial.
